

Pulling Harnesses

The staggered 3 and 4 way pulling harnesses are the conventional method for pulling up to 4 cables/pipes at once. Each leg can be attached to a cable grip or pulling carrot via a swivel link thus providing an approved safe connection. The added advantage of being staggered is such that it avoids bunching at the connecting point and therefore keeping the overall diameter to an absolute minimum plus giving added flexibility on bends etc. Harnesses are manufactured from galvanised wire rope

PH3 – 3 way staggered harness

PH4 – 4 way staggered harness
